Experiment - 6 : Workflow

Aim:

To create and configure workflows in Zoho Creator for automating actions in the job application process based on form submissions and record updates.

Theory:

Workflows automate tasks when a record is created, edited or deleted, or when a field changes. Actions include validations, field updates, notifications and Deluge scripts. Three workflows were configured on the Job_Application_Form:

Workflow	Trigger	Action
Validate Application and Set Date	Created → Validations on form submission	Checks experience range, internship rule, duplicate application and interview date; sets Application Submitted On and default Status
Send Application Confirmation Email	Created → Successful form submission	Emails the candidate the Application ID, department and status
Notify Application Status Change	Edited → Update of Status field	Emails the candidate the new status (also fires when a Kanban card is moved)

Procedure:

1. Open the application and go to the **Workflow** tab.
2. Click **New Workflow**, choose Job Application Form, record event **Created** and form event **Validations on form submission**; name it Validate Application and Set Date.
3. Add a **Deluge script** action with the validation code and save.
4. Create a second workflow on **Created** → **Successful form submission** named Send Application Confirmation Email with a sendmail script.
5. Create a third workflow on **Edited** → **Update of a field (Status)** named Notify Application Status Change.
6. Check that all workflows are listed as Enabled.
7. Submit a sample application and change a status to verify the workflows.

Program (Validation Script):

```
// Validate the job application, set submission date and default status
if(input.Years_Of_Experience < 0 || input.Years_Of_Experience > 40)
{
    alert "Years of Experience must be between 0 and 40.";
    cancel submit;
}
if(input.Employment_Type_Preferred == "Internship" && input.Years_Of_Experience > 2)
{
    alert "Internship applicants should have 0 to 2 years of experience.";
    cancel submit;
}
dup = Job_Application_Form[Email == input.Email && Department_Applied_For ==
input.Department_Applied_For];
if(dup.count() > 0)
{
    alert "An application with this email already exists for this department.";
    cancel submit;
```

```
}
if(input.Status == "Interview" && input.Scheduled_Interview_Date == null)
{
    alert "Please enter the Scheduled Interview Date for the Interview stage.";
    cancel submit;
}
input.Application_Submitted_On = zoho.currentdate;
if(input.Status == null)
{
    input.Status = "Applied";
}
```

Output:

Paste screenshot here (with browser address bar)
'Run workflow on any event in the form' screen filled for Validate Application and Set Date

Fig. 6.1: Creating a Workflow on Form Submission

Paste screenshot here (with browser address bar)
Deluge Script editor of Validate Application and Set Date

Fig. 6.2: Validation Script in the Deluge Editor

Paste screenshot here (with browser address bar)
Workflow setup with Edited > Update of a field > Status

Fig. 6.3: Status Change Workflow on Update of Status

Paste screenshot here (with browser address bar)
Form workflows list showing the three workflows as Enabled

Fig. 6.4: All Workflows Saved and Enabled

Paste screenshot here (with browser address bar)
Live form alert, e.g. 'Internship applicants should have 0 to 2 years of experience.'

Fig. 6.5: Validation Blocking an Invalid Application

Paste screenshot here (with browser address bar)
Report row of the new record with Application Submitted On = today and Status = Applied

Fig. 6.6: Submission Date and Status Set Automatically

Result:

Workflows were created and configured for the Job Application System. They validated applications, set the submission date and default status automatically and notified candidates on submission and status change, reducing manual work for HR.
